Abstract

Introduction: Arthritis is a chronic inflammatory disorder involving abnormal activity of immune system which usually affects elderly people, even though seen in younger generation in few cases. Many drugs are available in the market but carry its own drawbacks and limitations. Hence, the search for the new drugs is still under research.

Materials and Method: Wistar Albino rats were divided into five groups of 10 rats each. Complete Freund’s adjuvant (CFA) was injected to sub plantar region of the left hind paw of each rat. Administration of 1% Gum acacia (3 ml/kg, orally), Ethanolic extract of Leaves of Clerodendrum viscosum (75, 150 & 300mg/kg) and Indomethacin (10 mg/kg, orally) was started on the same day and continued for 21 days. Paw volume and body weight were recorded on the same day. Digital plethysmometer was used to record raw volume. On 5\textsuperscript{th} day, the volume of paw was recorded again to access the primary followed by measuring the paw volume of the non-injected paw regularly. From day 13\textsuperscript{th} to 21\textsuperscript{st}, was drug free day and on 21\textsuperscript{st} day the body weight and paw volume were recorded and the secondary lesions were graded.

Results: It was observed that Clerodendrum viscosum Ethanolic extract at doses of 150 mg/kg showed significant anti-arthritic activity on 5th day (p<0.01), 21st day (p<0.01) and Arthritic index (p<0.01). Clerodendrum viscosum Ethanolic extract at the dose of 300mg has also showed significant anti-arthritic activity on 5th day (p<0.05), on 21st day (p<0.01) and Arthritis index (p<0.01) by Complete Freund’s adjuvant (CFA) induced Arthritis in Wistar albino rats

Conclusion: Ethanolic Extract of Leaves of Clerodendrum viscosum has shown dose dependant Potent and efficacious anti-arthritic activity in Wistar Albino rats

Keywords: Arthritis. Clerodendrum viscosum, Complete Freund’s adjuvant, Ethanolic Extract, Wistar Albino rats

Introduction

Arthritis is a chronic inflammatory disorder that affects 0.5-1% of the world population with more women being affected than men.\textsuperscript{(1)}

Current treatments include non-steroidal anti-inflammatory drugs (NSAIDs), disease-modifying anti-rheumatic drugs (DMARDs) and biologics, but none are curative and there is a significant ‘non-responder’ rate.\textsuperscript{(2,3)} Rheumatoid arthritis is systemic inflammatory disease in which the destruction of articular cartilage leads to bone deformity and loss of joint function and ultimately severe pain. It is the most common inflammatory arthritis affecting approximately 1-2% of the general population worldwide i.e. 20 million people worldwide. Incidence increases with age, with women being affected three times more than men (Arthritis Research Campaign). The risk of incidence appears to be greatest for women between 40 and 50 years of age, and for men somewhat later, which makes the rheumatoid arthritis to be an age-related immune disorder.\textsuperscript{(4,5)}

However, besides their high cost, prolonged use of many of these drugs is associated with severe adverse reactions such as gastric and duodenal ulcers, complications in the small intestine and colon can occur, which cause colitis, bleeding, perforation, stricture, and chronic problems such as iron deficiency anemia and protein loss and toxicity. A report also states that, NSAIDs treatment enhances joint destruction in arthritis and inhibits glycosaminoglycan synthesis. Recently, there has been an increasing interest in natural food for scavenging the free radicals because of their wide acceptance.\textsuperscript{(6)}

The plant Clerodendron viscosum Vent. is an indigenous medicinal plant widely distributed in various parts of India, Ceylon, Malaya and Bangladesh.\textsuperscript{(7)} The genus Clerodendrum (Family: Lamiaceae/ Verbenaceae) commonly known as “Ittai” (Madras malligae) is very extensively distributed in tropical and subtropical regions of the world and it is comprised of small trees, shrubs and herbs. First description of the genus was given by Linnaeus in 1753, with the identification of C. infortunatum. After a decade, in 1763 Adanson changed its Latin name “Clerodendrum” to its Greek form “Clerodendon”. In Greek word Klero means chance and dendron means tree i.e. chance tree which means the tree which does not bring good luck like Clerodendron infortunatum or the tree which brings good luck like C. fortunatum. After about two centuries in 1942 Moldenke readopted the Latinized name ‘Clerodendrum’, which is now presently used by taxonomists for the classification and of the genus and species. Clerodendrum phlomidis (L) Gamble (verbinaceae), a related species has shown anti-arthritic activity in one of the previous study.\textsuperscript{(8)}

Our previous studies related to ethanolic extract of leaves of Clerodendrum viscosum has shown acute and chronic anti-inflammatory activity in different animal models of inflammation.\textsuperscript{(9,10)} In view of this, the present study was undertaken to evaluate anti-arthritic activity
of ethanolic extract of leaves of *Clerodendrum viscosum* in Wistar Albino rats as this species is most commonly seen in this part of region.

**Materials and Method**

Freund’s adjuvant induced Arthritis model was used to assess the anti-arthritic activity in Wister rats. Wistar Albino rats were divided into five groups of 10 rats each. Complete Freund’s adjuvant (CFA) consists of Mycobacterium butyricum (Difo) 0.05% suspended in heavy mineral/ paraffin oil was prepared by thoroughly grinding with a pestle and mortar to give a final concentration of 6 mg/ml. On the first day, they were injected with CFA (0.1ml) into sub plantar region of the left hind paw by a 26 gauge needle. Administration of 1% Gum acacia (3 ml/kg, orally), Ethanolic extract of Leaves of *Clerodendrum viscosum* respectively and Indomethacin (10 mg/kg, orally) which served as reference standard was started on the same day and continued for 21 days.

Administration of 1% Gum acacia (3 ml/kg, orally), Ethanolic extract of Leaves of *Clerodendrum viscosum* respectively and Indomethacin (10 mg/kg, orally) which served as reference standard was started on the same day and continued for 21 days. Paw volume and body weight were recorded on the same day. Digital plethysmometer (Rajesh Chemicals, Mumbai, India) was used to record raw volume. On 5th day, the volume of paw was recorded again to access the primary lesion and influence of Test / STD drug on this phase.

Thereafter the severity of the adjuvant induced arthritis was followed by measuring the paw volume of the non-injected paw regularly. From day 13th to 21st, the animals did not receive any treatment and on the 21st day the body weight and paw volume were recorded and the secondary lesions were graded (12,13) (Table 1).

**Grading of primary, secondary and arthritic lesion is as follows**

1. **Assessment of primary lesion**: Percent inhibition of paw volume of adjuvant injected left paw over the control measured on 5th day
2. **Assessment of secondary lesion**: Percent inhibition of paw volume of non-injected right paw over the controls measured on 21st day
3. **Assessment of arthritic index**: It is calculated as sum of the scores of primary and secondary lesion. The average of treated animals is compared with control groups.

The total percentage change is calculated as:

\[
\text{Percentage inhibition of injected left paw on 5th day} + \text{Percentage inhibition of non-injected right paw on 21st day} + \text{Percentage inhibition of Arthritis index.}
\]

EELCV- Ethanolic Extract of the Leaves of Clerodendrum viscosum, p.o. per oral

Discussion
Adjuvant induced arthritis is believed to be due to an immunological process associated with the development of delayed hypersensitivity to a component of the injected mycobacterial adjuvant.\(^{[15]}\)

Rat models are useful for studies of the pathogenesis of rheumatoid arthritis (RA) since rats are extraordinarily sensitive to induction of arthritis with adjuvants. Injection of not only the classical complete Freund’s adjuvant but also mineral oil without mycobacteria and pure adjuvants such as pristane and squalene, induce severe arthritis in many rat strains.\(^{[15]}\)

Our study has shown that Clerodendrum viscosum Ethanolic extract at doses of 150 mg/kg showed significant anti-arthritic activity on 5th day (p<0.01), 21st day (p<0.01) and Arthritic index (p<0.01). Clerodendrum viscosum Ethanolic extract at the dose of 300mg has also showed significant anti-arthritic activity on 5th day (p<0.05), on 21st day (p<0.01) and Arthritis index (p<0.01) by Complete Freund’s adjuvant (CFA) induced Arthritis in Wistar albino rats (Table 2 & Fig. 1-3).

Conclusion
Ethanolic Extract of Leaves of Clerodendrum viscosum has shown dose dependant Potent and efficacious anti-arthritic activity in Wistar Albino rats. However, further studies are required to evaluate its exact mechanism at molecular level as a potent and efficacious anti-arthritic agent.
